GROUP PITCH — OPPORTUNITY CANVAS

# TU Alert

*Real-time verified incident alerts + facility complaint reporting for Thammasat University — starting where the normalcy-bias problem actually lives.*

02 — USERS & CUSTOMERS

## User and customers

*What type of users and customers have problems your product addresses?*

- Users: students & staff in affected campus buildings
- Paying customer: university facilities management, security office, or student affairs — not the students

01 — PROBLEMS

## Problems

*What problems do prospective users have that your product solves?*

- Alarms carry no information → students assume it's a drill (normalcy bias) → real small incidents escalate before anyone reacts
- No formal channel to report broken or hazardous facility items → students give up, issues persist

03 — SOLUTIONS TODAY

## Solutions today

*How do users address their problems today?*

- Alarms: raw siren only, zero verification signal
- Complaints: word of mouth, informal LINE groups, email to facilities — untracked, no status

05 — SOLUTION IDEAS

## Solution ideas

*List of product features that solve a problem for your users.*

- Two-tier notification system: rare, high-priority push for confirmed incidents, kept separate from routine noise
- Async complaint tracker: photo + category + location, with visible status
- Admin dashboard for facilities/security: queue, resolution-time tracking, incident confirmation workflow

04 — HOW USED

## How will users use your solution?

*What will they do differently if they had what you offered?*

- Trust a push alert as real, react immediately — instead of waiting to see if others move
- Report a broken/hazardous item in seconds instead of not reporting it at all

06 — ADOPTION

## Adoption strategy

*How will they use and discover your solution?*

- Launch the complaint tracker first inside the TEPE program — no institutional gatekeeper needed
- Use real usage data to pitch the security office for a verified-alert pilot

10 — USER METRICS

## User metrics

*How will you measure the success of your solution?*

- Complaint volume + average resolution time
- Alert acknowledgment time during confirmed drills/incidents
- Push open rate on confirmed alerts — proof the channel isn't muted

07 — CHALLENGES

## Business challenges

*How do customer challenges impact your business?*

- Incident-alert accuracy is a liability issue for the university — false info or a missed real incident is reputational and legal risk, so sign-off will be slow and cautious
- Security-system integration is an institutional bottleneck, not a technical one

09 — BUDGET

## Budget

*What is the solution worth to you?*

- Build cost: ~0 THB cash — self-built on existing stack, ~1 sprint for MVP
- Ask: free single-faculty pilot → THB 15,000–30,000/yr per faculty once proven
- Anchor: trivial against the cost of one delayed-incident liability or PR event
- Burn: hosting only, a few hundred THB/month

08 — BUSINESS BENEFITS & METRIC

## Business benefits and metric

*What business performance metric will be affected by the success of this solution?*

**RESPONSE TIME**
- Faster facility issue resolution, provable against current manual process

**COMPLIANCE**
- Audit trail supports fire-safety compliance obligations

**SAFETY & PR**
- Reduced response lag on confirmed incidents
